

## Multiple Choice

1. **Answer:** A

*Options:* A) an antecedent boundary.; B) a geometric boundary.; C) a relict boundary.; D) a subsequent boundary.

*Note:* An antecedent boundary is established before extensive geographic understanding and mapping are developed, often based on physical features or cultural distinctions rather than precise measurements.

2. **Answer:** C

*Options:* A) Perforated states; B) Fragmented states; C) Elongated states; D) Prorupt states

*Note:* Elongated states, due to their extended shape and geographical diversity, often span multiple latitudes and altitudes, leading to a greater variety of climates and natural resources compared to more compact countries.

3. **Answer:** C

*Options:* A) South Asia; B) Europe; C) South America; D) Northeast United States

*Note:* South America is not considered one of the world's most densely populated regions because its overall population density is significantly lower compared to regions such as East Asia, South Asia, and Europe, which contain some of the highest concentrations of people.

4. **Answer:** C

*Options:* A) devolution theory.; B) domino theory.; C) heartland theory.; D) rimland theory.

*Note:* The heartland theory, proposed by geographer Halford Mackinder, asserts that control over the central landmass of Eurasia, particularly Europe, is crucial for global dominance due to its strategic geographic advantages and resources.

5. **Answer:** B

*Options:* A) A high level of confidence in central government; B) The existence of strong separatist groups; C) The existence of national transportation networks; D) The national anthem

*Note:* The existence of strong separatist groups is not a centripetal force because it represents a movement toward fragmentation and division within a state, rather than a force that promotes unity and cohesion.

## True / False

6. **Answer:** False

*Options:* A) True; B) False

*Note:* New medicines alone do not significantly reduce mortality rates in developing countries due to factors such as inadequate healthcare infrastructure, lack of access to treatments, and socio-economic challenges that affect overall health outcomes.

7. **Answer:** False

*Options:* A) True; B) False

*Note:* The United Kingdom has significant natural resources, including coal, natural gas, and oil, which are essential for modern industry, whereas Japan relies heavily on imports for its raw materials.

8. **Answer:** True

*Options:* A) True; B) False

*Note:* The statement is true because the Romance language family originated from Latin, the language of the Roman Empire, and includes Italian, Spanish, Portuguese, and Romanian as they all evolved from this common linguistic root.

9. **Answer:** False

*Options:* A) True; B) False

*Note:* The statement is false because while transnational corporations can influence local economies and politics, they often operate within the regulatory frameworks established by states, which can mitigate their impact.

10. **Answer:** False

*Options:* A) True; B) False

*Note:* The Eskimo-Aleut language family is not the most widely distributed in the Americas; that distinction belongs to the Indo-European and other language families, which cover a broader geographical area and have more speakers.

## Long Form Response

11. **Answer:** Johnny and Susie's move to Scotland is classified as migration because they are relocating from one place to another with the intention of staying permanently. This decision has significant implications, as it means they will be establishing their lives in a new environment, which includes adapting to a different culture, potentially learning a new language, and finding employment or schooling opportunities. Permanent migration often leads to changes in social networks and community ties, as they will need to build new relationships in Scotland. Overall, their move represents a significant life change that reflects the complex nature of human migration and its effects on individuals and communities.

*Note:* correct because it identifies the permanence of Johnny and Susie's move as a key factor in classifying it as migration, while also addressing the broader implications such as cultural adaptation, changes in social networks, and economic opportunities in their new environment.

12. **Answer:** The sector model of urban development, proposed by economist Homer Hoyt in 1939, illustrates how a city's residential areas grow in relation to its center and

major transportation routes, such as highways. According to this model, cities expand outward in distinct sectors or wedges from the central business district (CBD), with each sector representing different types of residential environments, such as low-income or middle-class neighborhoods. Major highways influence this growth by providing easy access to various sectors, encouraging people to move outward from the city center into areas that align with their socioeconomic status. As a result, the sector model helps explain the spatial organization of urban areas, highlighting the relationship between transportation and residential patterns.

*Note:* The answer correctly identifies the sector model's key premise that cities develop in wedge-shaped sectors based on proximity to the central business district and major transportation routes, which dictate the distribution of different residential areas.
