

Multiple Choice

1. **Answer:** C

Options: A) Kwakiutl; B) Hohokam; C) Anasazi; D) Mogollon

Note: The term "Anasazi," which means "ancient enemies" in the Navajo language, was adopted to refer to the ancestral Puebloan peoples of the American Southwest, highlighting the cultural exchange and linguistic influences among Native American groups.

2. **Answer:** B

Options: A) megaliths.; B) megafauna.; C) megafloa.; D) megatrons.

Note: The term "megafauna" specifically refers to the large mammals that lived during the Pleistocene era, including species such as mammoths and saber-toothed cats, distinguishing them from smaller herbivores.

3. **Answer:** B

Options: A) animals and human bodies from more than 15,000 to about 20,000 years ago; B) animals and hand stencils from more than 35,000 to about 40,000 years ago; C) animals and hand stencils from more than 45,000 to about 100,000 years ago; D) animals and abstract geometric shapes from 15,000 to more than 100,000 years ago

Note: The correct answer highlights the significant discovery of prehistoric art in Sulawesi, which includes depictions of animals and hand stencils dating back 35,000 to 40,000 years, illustrating early human creativity and cultural expression.

4. **Answer:** B

Options: A) 800,000 to 200,000 years ago.; B) 600,000 to 30,000 years ago.; C) 400,000 to 10,000 years ago.; D) 100,000 to 10,000 years ago.

Note: The correct answer is based on archaeological and fossil evidence that places the existence of premodern Homo sapiens, such as Neanderthals and early anatomically modern humans, within the time frame of approximately 600,000 to 30,000 years ago.

5. **Answer:** D

Options: A) Sunda; Wallacea; B) Wallacea; Beringia; C) Beringia; Sahul; D) Sunda; Sahul

Note: The correct answer is Sunda; Sahul because during the Pleistocene era, the islands of Java, Sumatra, Bali, and Borneo were part of the continental landmass known as Sunda, while the landmass connecting Australia, New Guinea, and Tasmania was referred to as Sahul.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: The first metals in South America were primarily produced through techniques such as hammering and cold working rather than casting methods.

7. **Answer:** True

Options: A) True; B) False

Note: Inca architecture is characterized by its advanced stone-cutting techniques that allowed for the creation of precisely shaped stones that fit together tightly, enabling the structures to withstand earthquakes without the need for mortar.

8. **Answer:** True

Options: A) True; B) False

Note: Levallois technology introduced a more advanced method of flake production, allowing for the creation of sharper and more specialized tools, which represented a significant evolution from earlier core tool-making techniques.

9. **Answer:** True

Options: A) True; B) False

Note: Genes inherited from Neandertals, which contribute to the metabolism of fat and susceptibility to certain diseases like Lupus, have been identified in modern Europeans, indicating a lasting genetic impact from ancient Neandertal populations.

10. **Answer:** False

Options: A) True; B) False

Note: The statement is false because the Shang Dynasty, which lasted from around 1600 to 1046 BCE, was followed by the Zhou Dynasty, which introduced significant political and philosophical changes that shaped Chinese civilization beyond the Shang period and into the subsequent centuries.

Long Form Response

11. **Answer:** Historically, various methods have been used to remove soil from around archaeological site materials, including hand excavation, mechanical digging, and water screening. Hand excavation allows for careful and precise removal of soil, which helps preserve artifacts and their context. Mechanical digging expedites the process but risks damaging delicate items, while water screening helps recover smaller artifacts from sediment. These methods are significant in archaeological practices as they directly impact how well sites are preserved and understood, ensuring that valuable historical information is not lost. Therefore, the choice of method reflects a balance between efficiency and the preservation of archaeological integrity.

Note: The answer correctly identifies and explains three distinct methods of soil

removal-hand excavation, mechanical digging, and water screening-while also addressing their respective advantages and risks, which are crucial for understanding their significance in archaeological practices and site preservation.

12. **Answer:** Absolute dating and relative dating are two methods used to determine the age of historical events and artifacts. Absolute dating provides a specific year or range of years, such as determining that a certain artifact is from 2500 BCE. In contrast, relative dating places events or objects in a sequence without assigning a specific date, like stating that an artifact is older than another found nearby. Understanding these differences is significant because absolute dating gives a clearer picture of timelines, while relative dating helps to understand the context and relationship between various historical events. Together, they enhance our comprehension of history by allowing us to piece together a more complete timeline of human development.

Note: The answer correctly distinguishes between absolute dating, which provides specific dates, and relative dating, which establishes a chronological sequence, thereby illustrating their respective roles in understanding historical timelines.
