

Multiple Choice

1. **Answer:** C

Options: A) Erectus fossils are found only in Africa.; B) Erectus possessed a smaller brain.; C) Erectus possessed a larger brain.; D) Erectus was a relatively short-lived species.

Note: Homo erectus had a larger brain than Homo habilis, indicating advanced cognitive abilities and a more complex social structure.

2. **Answer:** D

Options: A) artistic styles incorporating the same creatures; B) woven textiles displaying common motifs; C) worked metal objects; D) all the above

Note: The correct answer "all the above" is appropriate because the Chavin culture was characterized by a combination of shared religious beliefs, artistic styles, and architectural features that collectively served as a unifying element among its people.

3. **Answer:** B

Options: A) opportunistic foraging.; B) logistical collecting.; C) symbolic foraging.; D) mobiliary collecting.

Note: Logistical collecting refers to a subsistence strategy that involves the strategic planning and seasonal movement to gather resources, making it distinct from other forms of resource acquisition.

4. **Answer:** C

Options: A) humans.; B) environmental changes.; C) both humans and environmental changes.; D) humans who carried diseases over the land bridge.

Note: The extinction of Australian and American megafauna is attributed to a combination of human hunting practices and significant environmental changes, such as climate shifts, which collectively disrupted their habitats and food sources.

5. **Answer:** C

Options: A) Paleo-Eskimos; B) Dorset; C) Thule; D) Clovis

Note: Genetic evidence shows that the Thule culture, which originated in the Arctic around 1000 AD, is directly ancestral to the modern Inuit, as they migrated into the region and adapted to its environment.

True / False

6. **Answer:** True

Options: A) True; B) False

Note: Trace element analysis can identify specific elemental compositions that are

characteristic of certain geographic regions, allowing researchers to trace the origins of raw materials used in artifacts.

7. **Answer:** True

Options: A) True; B) False

Note: The statement is true because the Mogollon culture, which thrived in the Southwest from around 200 to 1400 CE, established agricultural practices and built permanent villages, demonstrating a shift from a nomadic to a sedentary lifestyle.

8. **Answer:** False

Options: A) True; B) False

Note: The North American Archaic period was characterized by a diverse subsistence strategy that primarily involved foraging and hunting-gathering, rather than an increased reliance on farming.

9. **Answer:** False

Options: A) True; B) False

Note: Ground-penetrating radar is primarily used for subsurface imaging and may not effectively detect surface-level changes, making it less suitable than other methods like aerial photography or visual surveys for that purpose.

10. **Answer:** False

Options: A) True; B) False

Note: Artifacts can vary in rarity and value depending on their significance and context, while ecofacts, which include natural remains like seeds or bones, can also be rare and valuable for understanding past environments and human interactions, making the statement false.

Long Form Response

11. **Answer:** The theory that *Homo erectus* may consist of several related species highlights the importance of geographic distinctions among early human ancestors. For example, *Homo ergaster* is believed to have evolved in Africa, while *Homo erectus* became prominent in Asia, indicating that different environments may have influenced their development. Additionally, *Homo antecessor*, found in Europe, suggests that these species adapted to diverse climates and resources across continents. This geographic variation implies that instead of a single species, there were potentially multiple lineages of early humans that shared common traits but developed unique characteristics based on their habitats. Understanding these distinctions helps us comprehend the complexity of human evolution and the migration patterns of our ancestors.
- Note:* correct because it emphasizes the significance of geographic variation in the evolution of different *Homo* species, illustrating how environmental factors influenced their adaptation and development across Africa, Asia, and Europe.
12. **Answer:** Archaeological research on indigenous North American burial sites faces significant ethical challenges, particularly regarding the treatment of ancient remains.

One major issue is that many of these burials are so old that it is impossible to establish direct historical or genealogical connections with modern descendants. This disconnect can lead to conflicts between the desire to study these remains for scientific knowledge and the cultural and spiritual beliefs of contemporary indigenous communities, who may view these sites as sacred. As a result, archaeologists must carefully navigate these ethical dilemmas, balancing the pursuit of knowledge with respect for the beliefs and rights of living descendants. Engaging with indigenous communities and seeking their input is essential to address these challenges responsibly.

Note: correct because it identifies the ethical dilemma arising from the tension between scientific inquiry into ancient remains and the cultural and spiritual beliefs of modern indigenous descendants, particularly when a lack of direct connection complicates respectful treatment of burial sites.
