

Multiple Choice

1. **Answer:** D

Options: A) a court of law; B) the hospital administration; C) no one, it should not be allowed under any circumstance; D) the patient's caregiver; E) a medical ethics committee

Note: According to Velleman, the patient's caregiver should decide whether a patient receives euthanasia because they possess the necessary understanding of the patient's medical condition, values, and best interests, which are crucial for making such a deeply personal and ethical decision.

2. **Answer:** A

Options: A) the amount of harm caused by an action.; B) whether or not one's maxim can be universalized.; C) the moral character of the person performing the action.; D) the distribution of wealth in society.; E) the consequences of particular acts.

Note: Brandt's version of utilitarianism emphasizes that the moral rightness of an action is determined by its consequences, specifically by evaluating the overall harm it causes, thereby prioritizing the minimization of suffering in ethical decision-making.

3. **Answer:** A

Options: A) can only be proven through extensive observation and study.; B) can be proven from principles that are known empirically.; C) can be proven, but only under certain conditions.; D) is inherently flawed and therefore cannot be proven.; E) is a theory that has been widely disproven.

Note: Mill argues that the principle of utility, which posits that actions are right if they promote happiness and wrong if they produce the opposite, requires empirical evidence gathered through observation and study to validate its application in diverse situations and human experiences.

4. **Answer:** A

Options: A) Red herring; B) Slippery slope; C) Either-or fallacy; D) Straw man argument; E) Hasty generalization

Note: The fallacy of accident, which involves applying a general rule to a specific case that is an exception, is often conflated with the red herring fallacy, as both involve diverting attention from the relevant issue, but it is important to note that the correct term for the fallacy of accident is actually "hasty generalization," not "red herring," suggesting that the provided answer is incorrect.

5. **Answer:** D

Options: A) more harmful on average than legally permitted harmful activities.; B) differing from the harms of other legally permitted harmful activities.; C) more detrimental to a person's character than others legally permitted harmful activities.; D) All of the above.

Note: Huemer's argument suggests that the harms of drug use are not significantly different from harms associated with other legal substances, thus undermining the justification for prohibiting drug use based on alleged unique harms.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: The fallacy of significance relates to the misinterpretation or misuse of statistical evidence, particularly in determining whether a result is meaningful, rather than focusing on emotional appeals.

7. **Answer:** False

Options: A) True; B) False

Note: Foot's Rescue I and Rescue II cases illustrate that harmful outcomes can occur even in the presence of good intentions, highlighting that moral responsibility is not solely determined by intent but also by the consequences of one's actions.

8. **Answer:** False

Options: A) True; B) False

Note: The statement is false because the hijab is primarily worn by many Muslim women as a personal expression of faith, identity, and agency, rather than as a reaction against Western cultural norms.

9. **Answer:** True

Options: A) True; B) False

Note: The fallacy of Extension is true because it involves misrepresenting an argument's intent by holding it accountable for outcomes or goals that were never part of its original purpose or claim.

10. **Answer:** False

Options: A) True; B) False

Note: The statement is false because attacking the person (ad hominem) specifically involves discrediting an argument by attacking the character or motives of the individual making the argument, rather than presenting irrelevant personal information.

Long Form Response

11. **Answer:** The statement "Since the university raised tuition, the president approved of it and the board didn't prevent it" can be analyzed in terms of its logical structure by identifying its constituent propositions. Let U represent "the university raised tuition," P represent "the president approved of it," and B represent "the board prevented it." The logical structure can be symbolized as $U \bullet (P \sim B)$, indicating that the raising of tuition (U) entails both the president's approval (P) and the non-intervention of the board ($\sim B$). This structure reflects a causal relationship where the action of raising tuition

necessitates the subsequent approval and inaction, thus providing a clear framework for understanding the implications of the statement in propositional logic.

Note: correct because it accurately identifies the key propositions in the statement and uses propositional logic to express the relationship between the university raising tuition, the president's approval, and the board's lack of prevention through symbolic representation.

12. **Answer:** From the premises $A \supset (B \bullet C)$, $\sim(B \bullet C)$, and $A \supset (D \vee B)$, we can immediately conclude that $\sim A$ must be true. The first premise asserts that if A is true, then both B and C must also be true; however, the second premise indicates that B and C are both false, as represented by $\sim(B \bullet C)$. Since the truth of A would necessitate the truth of B and C , the contradiction arising from the premises leads us to affirm that A cannot be true, thus establishing $\sim A$. Consequently, this conclusion not only negates the validity of A but also suggests that the remaining disjunct in $A \supset (D \vee B)$, namely $D \vee B$, must be examined further to ascertain truth-value implications.

Note: correct because the premises establish a logical contradiction: if A were true, then B and C must also be true, but the second premise asserts that both B and C are false, leading to the conclusion that A must be false ($\sim A$).
