

Multiple Choice

1. **Answer:** A

Options: A) identity vs. role confusion; B) autonomy vs. shame and doubt; C) ego integrity vs. despair; D) intimacy vs. isolation; E) industry vs. inferiority

Note: Erikson's identity vs. role confusion stage, which occurs during adolescence, corresponds to Freud's phallic stage because both focus on the development of a sense of self and the exploration of gender identity and sexual roles during critical formative years.

2. **Answer:** C

Options: A) the neutral role of the therapist; B) the client's interpersonal relationships in adulthood; C) early childhood experiences; D) the client's conscious thoughts and feelings; E) the use of cognitive behavioral strategies

Note: Object relations therapy, like Freudian psychodynamic therapy, emphasizes the significance of early childhood experiences in shaping personality and interpersonal relationships, highlighting the impact of early attachments on emotional development.

3. **Answer:** A

Options: A) most motor functions are determined by age and gender; B) motor functions are independent and do not correlate; C) motor functions correlate moderately and form 3 to 4 factors; D) most motor functions correlate highly and form a single factor; E) most motor functions correlate highly and form 2 single factor

Note: Numerous factor-analytic studies indicate that various motor functions are influenced significantly by biological factors such as age and gender, which shape physical development and capabilities.

4. **Answer:** C

Options: A) Implementing a quota system in all sectors of society; B) Use of subliminal messaging to alter beliefs; C) Providing information contrary to beliefs, equal-status contact, and interdependence; D) Promoting segregation to reduce intergroup conflict; E) Encouraging individuals to avoid discussing or acknowledging differences

Note: The correct answer is supported by social psychology research indicating that providing information that contradicts stereotypes, facilitating interactions between individuals of equal status, and promoting interdependence among groups can effectively reduce prejudice by challenging existing beliefs and fostering positive relationships.

5. **Answer:** A

Options: A) new response; B) aversive counterconditioning process; C) shock device; D) sexual response; E) electric shock

Note: In aversive counterconditioning, the new response, which is typically an aversive stimulus like electric shock, is used to replace the previously conditioned response to the

fetish, thereby making the fetish less appealing and altering the individual's behavioral response.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: The statement is false because while nonparental early care and education experiences can influence language development, the primary factors affecting vocal language skills are the quality of interactions with caregivers and the richness of the language environment, rather than the mere presence of nonparental care.

7. **Answer:** False

Options: A) True; B) False

Note: The desire to reproduce is primarily driven by biological and psychological factors, such as evolutionary instincts and hormonal influences, rather than being predominantly shaped by cultural constructs.

8. **Answer:** False

Options: A) True; B) False

Note: Research indicates that factors such as the quality of parental relationships, the child's temperament, and the level of family support are more significant predictors of post-divorce adjustment than the child's age at the time of divorce.

9. **Answer:** False

Options: A) True; B) False

Note: MRI is not the preferred method for assessing language processing areas in the right hemisphere of the brain because functional MRI (fMRI) is typically used instead, as it measures brain activity related to language tasks rather than just structural imaging.

10. **Answer:** False

Options: A) True; B) False

Note: The 'in-basket' technique is primarily designed to assess managerial and decision-making skills in candidates across various roles, rather than specifically evaluating customer service representatives.

Long Form Response

11. **Answer:** Psychosomatic disorders are characterized by the manifestation of physical symptoms that arise from psychological factors rather than identifiable physical causes. These disorders highlight the intricate connection between mind and body, where emotional distress can lead to real physiological pain or dysfunction, often complicating diagnosis and treatment. The therapeutic approaches commonly employed to treat psychosomatic disorders primarily focus on counseling and psychotherapy, which aim

to address the underlying psychological issues contributing to the symptoms. Techniques such as cognitive-behavioral therapy, mindfulness, and stress management are frequently utilized to help patients understand and manage their emotional responses, ultimately alleviating their physical symptoms. By addressing the mental health aspects, therapists can facilitate a holistic recovery process that recognizes the importance of both psychological and physical well-being.

Note: The answer correctly identifies psychosomatic disorders as conditions where psychological factors manifest as physical symptoms, emphasizing the mind-body connection and noting that treatment primarily involves counseling and psychotherapy to address the underlying emotional distress.

12. **Answer:** Psychological research indicates that exposure to violent television programming is correlated with increased aggressive behavior in viewers. This phenomenon can be attributed to several mechanisms, including desensitization to violence, the normalization of aggressive responses, and modeling of violent behavior as acceptable. As audiences absorb these portrayals, societal norms may shift, leading to a perception that aggression is a viable solution to conflict. Additionally, children and adolescents, who are particularly impressionable, may internalize these messages, potentially resulting in long-term behavioral changes and an increased tolerance for violence in various contexts. Thus, the interplay between violent media and aggression has significant implications for both individual behavior and broader societal attitudes towards violence.
- Note:* correct because it articulates the key mechanisms through which violent television programming can lead to increased aggression in viewers, emphasizing desensitization, normalization of violence, and the modeling of aggressive behavior, all of which contribute to changing societal norms regarding conflict resolution.
