

Multiple Choice

1. **Answer:** A

Options: A) make them more argumentative; B) make them more susceptible to accepting opposing views; C) weaken their resistance to later persuasive appeals; D) increase their attitudinal ambivalence; E) strengthen their existing views

Note: Exposing individuals to well-refuted arguments against their views can strengthen their original beliefs by prompting them to defend their positions more vigorously, thus making them more argumentative.

2. **Answer:** A

Options: A) Parataxic Distortion Mode: dealing w/ other like they're from early life; B) Parataxic Integration Mode: connecting unrelated events or ideas; C) Basic anxiety: feeling of helplessness/isolation in a hostile world; D) Eudaimonic Mode: pursuit of meaning and self-realization; E) Autistic Mode: living in a world of fantasies and daydreams

Note: The correct answer is Parataxic Distortion Mode because Harry Stack Sullivan proposed that individuals with schizophrenia often interpret interpersonal relationships through a distorted lens shaped by early life experiences, leading to misperceptions and inappropriate responses to others.

3. **Answer:** A

Options: A) Onset phase, abuse phase, dependency phase, abstinence phase; B) Prealcoholic phase, alcoholic phase, recovery phase, relapse phase; C) Initial phase, adaptive phase, dependent phase, deteriorative phase; D) Experimental phase, social use phase, intensive use phase, compulsive use phase; E) Initial phase, middle phase, crucial phase, termination phase

Note: The correct answer outlines Jellinek's model of alcohol addiction, which describes a sequential progression through the onset phase, abuse phase, dependency phase, and ultimately, the abstinence phase, capturing the typical trajectory of an alcoholic's relationship with alcohol.

4. **Answer:** D

Options: A) Biological predisposition and environmental triggers; B) Evolutionary psychology and learned behavior theory; C) Classical conditioning and operant aggression; D) social learning theory and innate aggression; E) Hormonal imbalance theory and cultural aggression

Note: The correct answer is social learning theory and innate aggression because these two perspectives provide contrasting insights into the origins of human aggressive behavior, with social learning theory emphasizing the role of environmental influences and observational learning, while innate aggression focuses on biological and evolutionary factors.

5. **Answer:** D

Options: A) more effective for minority clients; B) only effective for nonminority clients; C) more effective when client and therapist have different racial/ethnic origins; D) equally effective; E) only effective when client and therapist speak the same language

Note: Research has consistently shown that psychotherapy is equally effective for both minority and nonminority clients when culturally competent practices are employed, highlighting the importance of understanding and addressing the unique contexts and experiences of diverse populations in therapeutic settings.

True / False

6. **Answer:** True

Options: A) True; B) False

Note: The statement is true because in a data set where the mean is lower than the median and the mode is equal to the median, it indicates a skewed distribution with outliers pulling the mean down, which is common in psychological data.

7. **Answer:** False

Options: A) True; B) False

Note: The statement is false because education can be influenced by biases, perspectives, and cultural contexts, which may lead to partiality in the information presented, similar to how propaganda conveys biased information.

8. **Answer:** True

Options: A) True; B) False

Note: Electrical stimulation activates large-diameter nerve fibers that inhibit the transmission of pain signals through the spinal cord, thus effectively closing the gate in the gate-control theory of pain perception.

9. **Answer:** True

Options: A) True; B) False

Note: Job productivity is a significant predictor of employee retention over long periods in the workplace because high-performing employees are more likely to feel valued and engaged, leading to increased job satisfaction and a stronger commitment to staying with the organization.

10. **Answer:** True

Options: A) True; B) False

Note: Participation in research is ethical when students give informed consent without coercion, ensuring their autonomy and voluntary involvement in the study.

Long Form Response

11. **Answer:** Withdrawal delirium, particularly in the context of ecstasy (MDMA) use, presents significant psychological implications and risks. The acute discontinuation of

ecstasy can lead to severe withdrawal symptoms such as anxiety, depression, and cognitive disturbances, which may escalate to psychotic episodes in vulnerable individuals. The neurochemical changes induced by ecstasy, particularly the depletion of serotonin, can exacerbate mood disorders and impair cognitive functioning during withdrawal, increasing the risk of suicidal ideation and self-harm. Additionally, the social and environmental factors surrounding ecstasy use often contribute to a heightened sense of isolation and distress during withdrawal, further complicating recovery. Understanding these psychological dynamics is crucial for developing effective interventions and support systems for individuals experiencing ecstasy withdrawal.

Note: correct because it accurately identifies ecstasy (MDMA) as a substance associated with severe withdrawal symptoms and discusses its psychological implications, including anxiety, depression, cognitive disturbances, and the neurochemical impact on serotonin levels, which can lead to heightened risks of mood disorders and psychotic episodes during withdrawal.

12. **Answer:** Cultural values associated with Asians and Asian Americans often emphasize collectivism, respect for authority, familial obligation, and the importance of education. These values contribute to a worldview that prioritizes community and relational interdependence over individualism. In this context, fatalism-defined as the belief that events are predetermined and inevitable-is considered least characteristic because it contrasts sharply with the proactive and resilient attitudes typically seen in these cultures. Rather than resigning to fate, many Asians and Asian Americans demonstrate a strong sense of agency, striving to improve their circumstances through hard work and perseverance. This emphasis on individual effort and communal support reflects a belief in personal and collective efficacy, which undermines the notion of fatalism as a prevailing cultural trait.

Note: correct because it highlights the emphasis on collectivism, respect for authority, and proactive values in Asian and Asian American cultures, which directly opposes the passive acceptance of fate associated with fatalism.
