

Multiple Choice

1. **Answer:** A

Options: A) phonemes from the child's native language only.; B) Phonemes from the language most frequently spoken around the child.; C) Phonetic sounds specific to the child's geographical location.; D) Phonemes from the parents' native language only.; E) morphemes that the child has heard most frequently.

Note: The correct answer is supported by the fact that during the babbling stage, infants begin to produce sounds that reflect the phonetic characteristics of their native language, indicating their growing sensitivity to the linguistic environment around them.

2. **Answer:** D

Options: A) associative; B) distributive; C) additive; D) disjunctive; E) divisive

Note: The correct answer is "disjunctive" because in a disjunctive task, the group's success relies on the best solution provided by any individual member, leading to the selection of that solution as the group's final decision.

3. **Answer:** D

Options: A) avoid setting any specific goals to maintain flexibility; B) focus on developing a deep understanding of the crisis before setting goals; C) try to ensure that the client becomes calm and relaxed; D) agree upon clear-cut goals and keep the sessions focused on these goals; E) primarily use medication as a means of managing the crisis

Note: The correct answer highlights the fundamental aspect of brief crisis-oriented therapy, which is the emphasis on establishing specific, measurable goals to create a structured and focused therapeutic process that addresses immediate issues effectively.

4. **Answer:** A

Options: A) increase access to mental health services; B) create a support system for people with mental health problems; C) educate the community about mental health issues; D) prevent community disintegration; E) deal with problems before they occur

Note: Secondary prevention in community mental health focuses on reducing the impact of mental health issues by facilitating early intervention and increasing access to mental health services for those at risk or experiencing early symptoms.

5. **Answer:** B

Options: A) short-term memory; B) sensory memory; C) eidetic memory; D) episodic memory; E) explicit memory

Note: Sensory memory is the initial stage in the three-box information processing model where incoming sensory information is briefly stored in its raw form before it is processed for further encoding into short-term or long-term memory.

True / False

6. **Answer:** True

Options: A) True; B) False

Note: Individuals with the XXY genotype, typical of Klinefelter syndrome, often experience sterility due to the impaired testicular development and hormonal imbalances that affect sperm production.

7. **Answer:** False

Options: A) True; B) False

Note: Menarche specifically refers to the first menstrual cycle in females, which typically occurs around age 12, while males do not experience this biological event, thus making the statement false.

8. **Answer:** False

Options: A) True; B) False

Note: The statement is false because children at this stage typically obey rules to avoid punishment or gain rewards rather than out of a belief in the inherent goodness of rules and laws, reflecting a more egocentric understanding of morality.

9. **Answer:** True

Options: A) True; B) False

Note: Fundamental attribution bias is true because it highlights the psychological tendency to attribute others' actions to their character or disposition while underestimating situational influences, which can lead to misinterpretations of behaviors, such as a boss's inconsistency.

10. **Answer:** True

Options: A) True; B) False

Note: The statement is true because reducing both within-group and between-group variability decreases the overall variability in the denominator of the F-ratio, which is used to assess the significance of group differences in ANOVA.

Long Form Response

11. **Answer:** Richard Christie identifies several characteristics of a good manipulator that significantly impact interpersonal dynamics and ethical considerations in psychology. Firstly, a manipulator often exhibits a relative lack of emotion when interacting with others, which allows them to navigate social situations with calculated detachment, making it easier to influence or control outcomes without being hindered by empathy. Secondly, their lack of conventional morality enables them to engage in behaviors that others may deem unethical, prioritizing personal gain over societal norms. Additionally, manipulators typically have no strong ideological commitments, allowing them to adapt their strategies and beliefs to suit their objectives without moral conflict. Finally, their relative psychological balance equips them with the stability needed to execute manipulative tactics effectively, fostering an environment where ethical boundaries can

be easily transgressed. Collectively, these traits not only shape the manipulator's interactions but also raise critical ethical questions about the implications of such behaviors in psychological practice and interpersonal relationships.

Note: The answer correctly identifies key traits of a good manipulator as defined by Richard Christie, specifically their emotional detachment and lack of conventional morality, which facilitate their ability to influence interpersonal dynamics while raising significant ethical concerns in psychological practices.

12. **Answer:** To understand Susan's behavior of frequently leaving her seat, it is essential to analyze various observational data in conjunction with her academic performance. Observational data can reveal patterns in her classroom engagement, social interactions, and emotional responses, which may contribute to her restlessness. If her academic performance is below grade level, this could indicate that she is struggling to grasp the material, leading to disengagement and subsequent seat-leaving as a coping mechanism. Conversely, if her performance is strong, her behavior might suggest a need for more stimulating or challenging tasks. Ultimately, integrating these insights allows educators and psychologists to formulate targeted interventions that address both Susan's behavioral tendencies and her academic needs, fostering a more supportive learning environment.

Note: correct because it emphasizes the importance of integrating observational data on Susan's behavior with her academic performance to uncover potential underlying issues, such as disengagement due to academic struggles, which can contribute to her frequent seat-leaving.
