

Multiple Choice

1. **Answer:** A

Options: A) Minnesota Multiphasic Personality Inventory; B) Rey 15-Item Memory Test; C) Beck Depression Inventory; D) The General Aptitude Test Battery; E) Recognition Memory Test

Note: The Minnesota Multiphasic Personality Inventory (MMPI) is primarily designed to assess personality traits and psychopathology rather than specifically measuring symptom validity or detecting malingering, which distinguishes it from other assessment measures focused on these areas.

2. **Answer:** A

Options: A) Perls.; B) Maslow.; C) Erikson.; D) Piaget.; E) Rogers.

Note: The correct answer is Perls because he emphasized the importance of interpersonal relationships and self-awareness in his Gestalt therapy approach, which aligns with the three major life tasks of friendship, occupation, and love.

3. **Answer:** D

Options: A) 10; B) 13.2; C) 9.5; D) 11.7; E) 15

Note: The correct answer is 11.7 because it accurately reflects the calculated variance of the children's ages, which measures the average squared deviation from the mean age, providing insight into the variability of their ages.

4. **Answer:** E

Options: A) two; B) nine; C) ten; D) eight; E) one

Note: Research on bystander intervention highlights the "bystander effect," which asserts that as the number of bystanders increases, the likelihood of any one individual offering help decreases due to diffusion of responsibility, making a single bystander the most likely to intervene.

5. **Answer:** C

Options: A) Naturalist intelligence; B) Spatial intelligence; C) Crystallized intelligence; D) Emotional intelligence; E) Kinesthetic intelligence

Note: Crystallized intelligence refers to the ability to use knowledge, skills, and experience acquired over time, which is essential for answering the trivia-based questions presented in a game show like Jeopardy!.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: This statement is false because, in the United States, accountability for academic

failures is often viewed as a shared responsibility between the educational system and the individual student, whereas in Japan, there is a cultural expectation that parents play a more direct role in their children's educational success, leading to greater accountability assigned to parents.

7. **Answer:** True

Options: A) True; B) False

Note: Pascale's focus on processing strategies for learning new information aligns with the core principles of cognitive psychology, which emphasizes understanding mental processes such as perception, memory, and problem-solving.

8. **Answer:** True

Options: A) True; B) False

Note: Validity in test construction is true because it encompasses both the accuracy of the measurement and the representative diversity of question types that effectively assess the intended psychological constructs.

9. **Answer:** True

Options: A) True; B) False

Note: During preschool and middle childhood, children's cognitive development involves the integration of sensory experiences, allowing them to recognize letters by interpreting their motion, stability, and orientation as they interact with their environment.

10. **Answer:** True

Options: A) True; B) False

Note: During Piaget's preoperational stage, which occurs roughly between ages 2 and 7, children begin to form mental representations of the world, allowing them to symbolize objects, people, and experiences, thereby developing internal representational systems.

Long Form Response

11. **Answer:** The serial position effect, which describes how individuals tend to recall items from the beginning and end of a list more effectively than those from the middle, has significant implications for memory retention. In Dan's case, when asked to recall vocabulary words two days after studying, he is likely to remember the words positioned at the end of the list more readily than those in the middle. This phenomenon occurs due to the recency effect, where items at the end are still fresh in short-term memory, enhancing the likelihood of recall. Conversely, words in the middle may suffer from interference and decay, leading to poorer retention. Thus, Dan's recall will likely reflect this pattern, emphasizing the importance of item position in memory processes.

Note: correct because it accurately identifies the serial position effect, which includes both the primacy effect (better recall of items at the beginning of a list) and the recency effect (better recall of items at the end), and applies this concept to Dan's likely memory retention of vocabulary words based on their positions in the list.

12. **Answer:** Theories such as the "Aggressive Energy" theory and the "Natural Born Killer" theory posit that aggression is an intrinsic part of human behavior necessary for survival and social dominance. The "Aggressive Energy" theory suggests that individuals possess a reservoir of aggressive energy that must be expressed to maintain psychological balance, implying that uncontrolled aggression can lead to maladaptive behaviors. Conversely, the "Natural Born Killer" theory posits that certain biological and evolutionary factors predispose humans to aggression, framing it as an instinctual drive that has been historically advantageous for competition and resource acquisition. Both theories highlight the complexity of aggression, suggesting that while it may serve adaptive functions, its implications in contemporary psychological discourse necessitate a nuanced understanding of aggression's role in societal and individual contexts, particularly concerning mental health and social behavior.
- Note:* correct because it effectively identifies and analyzes key theories-specifically the "Aggressive Energy" and "Natural Born Killer" theories-that frame aggression as an essential component of human behavior with significant implications for understanding psychological health and social dynamics.
