

Multiple Choice

1. **Answer:** A

Options: A) analytic, spatial, and verbal; B) mathematical, spatial, and analytic; C) verbal, mathematical, and recognizing emotional expressions; D) mathematical, spatial, and musical; E) spatial, musical, and recognizing emotional expressions

Note: The left cerebral hemisphere is primarily responsible for analytic and verbal functions, as it is dominant in language processing and logical reasoning, while also contributing to spatial processing in a more analytical context.

2. **Answer:** A

Options: A) overt (explicit) sexual conduct.; B) the act of exchanging sexual favors for monetary rewards.; C) "the judgment of a "reasonable woman"" that an act is offensive. "; D) the judgment of a "reasonable man" that an act is offensive.; E) a situation where an employee makes sexual demands to their supervisor.

Note: The correct answer is based on the definition of "quid pro quo" in sexual harassment, which refers to situations where an individual is offered a benefit or advantage in exchange for explicit sexual conduct, highlighting the power dynamics and coercive nature of such interactions.

3. **Answer:** B

Options: A) the quality of the parent-child relationships prior to the divorce.; B) the degree of post-divorce conflict between the parents.; C) the child's academic performance prior to the divorce.; D) the frequency of contact with the noncustodial parent.; E) the gender of the child.

Note: Research indicates that a lower level of post-divorce conflict between parents fosters a more supportive environment for children, thereby significantly enhancing their emotional and psychological adjustment during and after the divorce process.

4. **Answer:** C

Options: A) that apes are able to use objects from their natural environment as tools.; B) that apes can learn through operant conditioning.; C) that learning can occur via insight.; D) the apes' ability to communicate.; E) latent learning in primates.

Note: Kohler's studies with apes illustrated that problem-solving can occur suddenly through a cognitive process of insight rather than through trial-and-error learning, showcasing the ability of the animals to understand the relationships between elements in their environment.

5. **Answer:** A

Options: A) the unconditioned stimulus a few seconds before the conditioned stimulus; B) a neutral stimulus; C) both the conditioned and unconditioned stimulus simultaneously; D) a neutral stimulus immediately after the unconditioned stimulus; E) the unconditioned stimulus without a neutral stimulus

Note: The correct answer is based on the principle of classical conditioning, where presenting the unconditioned stimulus before the conditioned stimulus can create a new association that inhibits the conditioned response, effectively leading to its extinction.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: Research in psychology and behavioral genetics indicates that both genetic predispositions and environmental factors contribute to aggressive behavior in humans, demonstrating that it is not solely a learned behavior.

7. **Answer:** True

Options: A) True; B) False

Note: In expectancy theory, valence is defined as the degree to which an individual values the rewards that may result from their performance, thereby influencing their motivation to achieve those outcomes.

8. **Answer:** True

Options: A) True; B) False

Note: The statement is true because transfer of training encompasses various forms of applying learned skills or principles, including direct application in similar contexts, indirect application to related scenarios, and the generalization of learned concepts across different situations.

9. **Answer:** True

Options: A) True; B) False

Note: Individuals in the pseudoindependent stage critically examine their own racial identity and begin to recognize the systemic nature of racism, including the ways in which white individuals contribute to and benefit from these systems of oppression.

10. **Answer:** False

Options: A) True; B) False

Note: High levels of arousal can lead to anxiety and impair cognitive functions, thus hindering optimal learning and performance rather than enhancing it.

Long Form Response

11. **Answer:** Cognitive dissonance, as proposed by Leon Festinger, refers to the psychological discomfort experienced when an individual holds two or more contradictory beliefs, values, or attitudes, or when their behavior does not align with their convictions. This theory posits that individuals are motivated to reduce this dissonance, often leading to changes in either their beliefs or behaviors to achieve consonance. For instance, if a person values health but smokes, they might either quit smoking or downplay the health risks associated with it to resolve the conflict. The implications for behavior

change are significant, as understanding cognitive dissonance can facilitate interventions aimed at promoting healthier behaviors by highlighting inconsistencies between individuals' actions and their self-identified values. Thus, cognitive dissonance serves as a driving force in the process of aligning actions with beliefs, ultimately shaping behavior through the pursuit of internal consistency.

Note: The answer correctly identifies cognitive dissonance as the psychological discomfort arising from conflicting beliefs and behaviors, and it highlights the individual's motivation to resolve this dissonance through behavior or belief modification, illustrating its implications for behavior change.

12. **Answer:** Vicarious liability holds an employer or principal legally responsible for the negligent actions of an employee or agent, particularly in the context of a psychologist's role as a researcher. This principle has significant implications for ethical and legal considerations in psychological research, as psychologists must ensure that their research practices comply with ethical standards and legal regulations to protect both participants and themselves. If a researcher's actions, such as breaching confidentiality or failing to obtain informed consent, lead to harm or legal repercussions, the institution may be held liable, thus emphasizing the importance of rigorous ethical oversight and training. Moreover, the potential for vicarious liability necessitates that psychologists adopt robust protocols and maintain a clear understanding of their responsibilities, ensuring that their research contributions do not compromise the welfare of participants or the integrity of the research process. Ultimately, recognizing the implications of vicarious liability encourages a proactive approach to ethical research practices within the field of psychology.

Note: correct because it accurately identifies vicarious liability as a legal principle holding psychologists accountable for their employees' negligent actions in research, thereby emphasizing the importance of adhering to ethical standards and legal regulations to safeguard participants and mitigate legal risks.
