

Multiple Choice

1. **Answer:** A

Options: A) identification; B) alliance; C) interpersonal learning; D) disclosure; E) catharsis

Note: Identification in group therapy allows members to relate to one another's experiences and emotions, mirroring the therapist-client dynamic in individual therapy, thereby facilitating personal growth and healing through shared understanding and connection.

2. **Answer:** A

Options: A) linguistic relativity hypothesis; B) morphemes; C) syntactic structures; D) transformational-generative grammar; E) sociolinguistics

Note: The linguistic relativity hypothesis is relevant because it underscores the debate between Chomsky's innate language acquisition device and Skinner's behaviorist approach, highlighting how language structure and thought are interconnected, which reflects their differing views on the role of environment versus inherent cognitive capabilities in language development.

3. **Answer:** A

Options: A) low self-esteem.; B) a strong id.; C) a high level of anxiety.; D) a strong superego.; E) high levels of self-consciousness.

Note: The belief that one's attitudes and behavior significantly influence outcomes can indicate low self-esteem, as individuals with low self-esteem often internalize failures and attribute their circumstances to personal shortcomings rather than external factors.

4. **Answer:** B

Options: A) cell body; B) myelin; C) synaptic vesicles; D) glial cells; E) terminal buttons

Note: Myelin is a fatty substance that insulates nerve fibers, facilitating faster electrical impulses along the axon through saltatory conduction, which is crucial for the electrical aspect of neural transmission.

5. **Answer:** E

Options: A) auditory and visual; B) internal and external; C) tactile and olfactory; D) biological and physical; E) energy and chemical

Note: The correct answer is "energy and chemical" because human senses can be classified based on their reliance on energy-detecting modalities, such as sight and hearing, and chemical-detecting modalities, such as taste and smell, which correspond to different forms of stimuli they process from the environment.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: The statement is false because the initial step in creating a new training program typically involves a needs assessment to identify specific training requirements before conducting market research analysis.

7. **Answer:** False

Options: A) True; B) False

Note: Turning up the volume increases the amplitude of the sound wave, which affects the loudness but does not change the frequency, and therefore the pitch, of the tone heard by the listener.

8. **Answer:** True

Options: A) True; B) False

Note: The standard deviation of 5.92 for the sample measurements 1, 3, 7, 10, and 14 indicates a moderate level of variability because it reflects the average distance of each measurement from the mean, showing that the values are spread out to a degree that is neither too low (indicating low variability) nor excessively high (indicating high variability).

9. **Answer:** True

Options: A) True; B) False

Note: Trend analysis is used in research to identify patterns or changes over time in quantitative independent variables, allowing for a deeper understanding of relationships and effects within psychological studies.

10. **Answer:** False

Options: A) True; B) False

Note: While LSD and schizophrenia may share some overlapping symptoms, such as hallucinations and altered perceptions, they differ significantly in their underlying mechanisms, duration of effects, and the overall experience, which undermines the notion that LSD can be classified as a psychomimetic drug in the same way as schizophrenia.

Long Form Response

11. **Answer:** The classification system for behavior disorders, as defined by the American Psychiatric Association (APA), faces significant criticism primarily due to its frequent updates, which can create confusion among mental health professionals. Frequent revisions may lead to inconsistencies in diagnosis and treatment, as practitioners struggle to keep up with the evolving criteria and terminologies. This rapid change can undermine the stability of therapeutic practices and research, as well as disrupt the continuity of care for patients. Moreover, the lack of consensus on the validity and reliability of

newly introduced categories may further complicate the professional landscape, leading to potential misdiagnoses and varying treatment approaches. Ultimately, while the intention behind these updates is to enhance understanding and improve care, they can paradoxically hinder effective practice in the field of psychology.

Note: The answer correctly highlights that the frequent updates to the APA's classification system for behavior disorders can lead to confusion and inconsistencies in diagnosis and treatment, ultimately undermining therapeutic practices and research stability in the field.

12. **Answer:** Erikson's concept of integrity versus despair represents the final stage of his psychosocial development theory, occurring typically in late adulthood. During this stage, individuals reflect on their lives, assessing their experiences and accomplishments. Those who achieve a sense of integrity feel a sense of fulfillment and coherence, embracing their life story and accepting their past choices. Conversely, individuals who experience despair may grapple with feelings of regret and dissatisfaction, leading to a sense of failure in having not achieved their aspirations. The resolution of this stage significantly influences how individuals view their legacy and cope with the inevitability of death, ultimately shaping their emotional well-being and perspective on life. Thus, integrity fosters a positive self-concept and acceptance, while despair can lead to a profound sense of loss and unresolved conflicts.

Note: correct because it accurately describes Erikson's integrity versus despair stage as a crucial period in late adulthood where individuals evaluate their lives, leading either to a sense of fulfillment and acceptance or to feelings of regret and dissatisfaction based on their reflections and life choices.
