

Multiple Choice

1. **Answer:** A

Options: A) Lesser focus on self-discovery and role experimentation; B) Increased social isolation and withdrawal from social contexts; C) more reliance on parents; D) Declining interest in establishing an identity; E) increased independence from peers

Note: The correct answer reflects the understanding that during adolescence, individuals often experience a shift in focus from self-discovery and role experimentation to more stable identity formation and social relationships, as they navigate the complexities of emerging adulthood.

2. **Answer:** A

Options: A) Projective; B) Empirically keyed; C) Personality test; D) Multiple-choice; E) Computer adaptive test

Note: Projective tests are often considered to have a lower risk of adverse impact on minority groups because they assess personality and attitudes through open-ended responses, which can minimize cultural biases inherent in more structured tests.

3. **Answer:** A

Options: A) Biological, psychoanalytic, and social learning; B) Learning, constructivist, and information processing; C) Biological, evolutionary, and cognitive; D) Contextual, evolutionary, and psychodynamic; E) Sociocultural, learning, and ecological

Note: The correct answer identifies three foundational approaches-biological, psychoanalytic, and social learning-that each offer distinct perspectives on human development, emphasizing the interplay of biological factors, unconscious motivations, and learned behaviors in shaping psychological growth.

4. **Answer:** A

Options: A) there is no one else around.; B) there are several bystanders.; C) there are several bystanders, all of whom are busy with their own tasks.; D) there are several bystanders of the same gender.; E) there are several bystanders of the opposite gender.

Note: The correct answer is based on the bystander effect, which posits that individuals are less likely to offer help in an emergency when others are present due to diffusion of responsibility, making it more likely for someone to assist when they are alone.

5. **Answer:** A

Options: A) family dynamics; B) career satisfaction; C) communication skills; D) emotional intelligence; E) insight

Note: The correct answer is family dynamics because Howard et al.'s phase model emphasizes the importance of addressing interpersonal relationships and family interactions early in the therapeutic process to facilitate effective change.

True / False

6. **Answer:** True

Options: A) True; B) False

Note: A major task of a Rogerian therapist is to create a non-judgmental and empathetic environment, which fosters openness and encourages clients to explore their thoughts and feelings freely.

7. **Answer:** False

Options: A) True; B) False

Note: The frontal lobe is primarily involved in higher cognitive functions such as decision-making and planning, while the processing of sensory information from the optic nerve primarily occurs in the occipital lobe.

8. **Answer:** True

Options: A) True; B) False

Note: Self-disclosure by the psychologist is considered a recommended technique in object relations therapy because it helps to build trust and a deeper emotional connection between the therapist and the client, facilitating a more effective therapeutic relationship.

9. **Answer:** True

Options: A) True; B) False

Note: Moderate punishment can deter behavior in the short term, but it does not address the underlying motivations or reinforce alternative behaviors, leading to the potential for the original response to resurface or strengthen over time as the effects of the punishment diminish.

10. **Answer:** True

Options: A) True; B) False

Note: Aversive techniques can create fear and anxiety in learners, which hinders their ability to engage in the learning process and reduces their capacity to absorb new behaviors effectively.

Long Form Response

11. **Answer:** Parallel memory codes play a crucial role in elucidating the relationship between memory and thought processes by enabling the simultaneous storage and retrieval of information from various sources. This multifaceted storage mechanism allows individuals to access different types of memories-such as sensory, episodic, and semantic-concurrently after an experience, thereby enriching cognitive functioning and enhancing problem-solving capabilities. For instance, when recalling a specific event, a person may simultaneously access contextual details, emotional responses, and learned knowledge related to that event, facilitating a more holistic understanding. This interplay underscores how interconnected memory systems contribute to more complex

thought processes, such as decision-making and creative thinking, by integrating diverse informational inputs. Ultimately, the concept of parallel memory codes illustrates the dynamic nature of cognition, where memory serves not only as a repository of past experiences but also as a vital component in shaping ongoing thought and behavior.

Note: correct because it emphasizes how parallel memory codes facilitate the simultaneous access of diverse memory types, which enhances cognitive functioning and problem-solving abilities by integrating various forms of information during thought processes.

12. **Answer:** T-scores are standardized scores that are commonly used in psychological research to facilitate the interpretation of test results. They are characterized by a mean (M) of 0 and a standard deviation (SD) of 1, which allows for easy comparison across different tests and populations. This standardization helps researchers identify how an individual's score relates to the normative sample, providing insights into their psychological functioning. T-scores are particularly useful in studies involving clinical assessments, where they allow for the evaluation of severity and changes over time, thereby enhancing the understanding of psychological constructs. Overall, the use of T-scores aids in making sense of data within the context of variability and distribution in psychological research.

Note: correct because it accurately describes T-scores as standardized scores with a mean of 0 and a standard deviation of 1, emphasizing their role in facilitating comparisons across different tests and populations in psychological research.
