

Multiple Choice

1. **Answer:** B

Options: A) A subject consistently provides correct answers to every test item; B) A psychometrician consistently underestimates IQ scores by 10 points; C) A test item is answered correctly by every student in a given class; D) A subject consistently provides wrong answers to every test item; E) A test-retest reliability coefficient is high for several samples

Note: This answer is correct because constant error refers to a systematic bias in measurement, and the psychometrician's consistent underestimation of IQ scores by 10 points exemplifies this type of error by producing a uniform deviation from the true score across all assessments.

2. **Answer:** C

Options: A) Rehearsal and Forgetting; B) Sensory Input and Cognitive Load; C) Interference and Time-Decay; D) Capacity and Duration; E) Chunking and Associative Learning

Note: Interference occurs when new information disrupts the retention of existing information, while time-decay refers to the gradual loss of memory over time, both of which are recognized as the primary mechanisms that limit the capacity of short-term memory.

3. **Answer:** A

Options: A) Mood swings, depression, anxiety; B) Social media usage, internet browsing habits, television viewing preferences; C) Intelligence, memory, reaction time; D) Speech patterns, tone of voice, cadence; E) Happiness, sadness, anger

Note: The correct answer identifies mood swings, depression, and anxiety as indicators of emotion because these psychological states reflect fluctuations in emotional experiences and can significantly impact an individual's overall emotional well-being.

4. **Answer:** A

Options: A) psychoanalysis; B) self-report inventories; C) longitudinal research; D) naturalistic observation; E) experimental method

Note: The correct answer is psychoanalysis because it emphasizes the exploration of unconscious processes and early childhood experiences, which are central to understanding human development according to developmental psychologists.

5. **Answer:** A

Options: A) Intelligence is a subset of personality traits; B) Personality completely determines intelligence; C) Intelligence enhances personality traits; D) Personality and intelligence are the same concept; E) Intelligence and personality have no connection

Note: Intelligence is considered a subset of personality traits because it influences how

individuals think, learn, and interact with their environment, thereby shaping their overall personality.

True / False

6. **Answer:** True

Options: A) True; B) False

Note: The statement is true because compliance, identification, and internalization represent different ways individuals respond to social influence, with compliance driven by external rewards or pressures, identification based on a desire to be associated with a group, and internalization reflecting a deeper acceptance of the influencing beliefs as one's own.

7. **Answer:** False

Options: A) True; B) False

Note: Strong organizational culture typically fosters a sense of belonging and shared values among employees, leading to higher levels of job commitment rather than low levels.

8. **Answer:** False

Options: A) True; B) False

Note: Harry Stack Sullivan did not identify schizophrenia as being marked by the Dysphoric Mode; instead, he emphasized interpersonal relationships and the importance of anxiety in understanding schizophrenia.

9. **Answer:** True

Options: A) True; B) False

Note: The statement is true because transfer of training encompasses various forms of knowledge application, including direct transfer (applying learned skills in similar contexts), indirect transfer (applying learned skills in different but related contexts), and transfer of principles (using underlying concepts in new situations), all of which occur in both everyday life and formal educational settings.

10. **Answer:** False

Options: A) True; B) False

Note: The statement is false because observational learning also involves motivation, as individuals are more likely to imitate behaviors they perceive as rewarding or desirable.

Long Form Response

11. **Answer:** A pay incentive program in the workplace is designed to boost employee productivity by offering financial rewards for achieving specific performance goals. The psychological underpinnings of such programs are rooted in motivation theories, particularly the principles of reinforcement, which suggest that rewarding desired behaviors can lead to increased frequency of those behaviors. One commonly used incentive plan

is the piece-rate system, where employees are paid a fixed amount for each unit of output they produce. This approach not only encourages higher productivity but also fosters a sense of ownership and accountability among employees, as they directly see the correlation between their efforts and their earnings. Ultimately, effective incentive programs can enhance job satisfaction and organizational commitment, making them a valuable tool in workplace management.

Note: correct because it effectively connects the concept of pay incentive programs to psychological motivation theories, specifically reinforcement, and provides a relevant example in the form of the piece-rate system to illustrate how such incentives function in practice.

12. **Answer:** Nutritional content, method of food storage, and time since the last meal significantly influence the intensity of taste perception in humans. Foods rich in certain nutrients, such as umami compounds, can heighten taste sensitivity, as the body may crave these nutrients more intensely when deficient. Conversely, improper storage can lead to the degradation of flavors and aromas, diminishing taste perception. Additionally, the time elapsed since the last meal can alter taste sensitivity; a longer duration may enhance hunger and thus increase the perception of flavors when food is finally consumed. Together, these factors illustrate the complex interplay between physiological needs and sensory experiences in food consumption.

Note: correct because it effectively connects the influence of nutritional content on cravings and taste sensitivity, the impact of food storage on flavor degradation, and how time since the last meal affects overall taste perception, demonstrating a comprehensive understanding of the factors that shape human taste experiences.
