

Multiple Choice

1. **Answer:** A

Options: A) pleasure and a visual stimulus; B) thirst and a particular color; C) movement and shock; D) punishments and rewards; E) anger and a specific musical note

Note: Garcia and Koelling's research demonstrated that organisms quickly learn to associate pleasurable stimuli with visual cues due to the evolutionary advantage of forming positive associations that promote survival, making these pairs the most powerful in learned aversions.

2. **Answer:** B

Options: A) perception, insight, retention, recall; B) arousal, motivation, reinforcement, and association; C) analysis, synthesis, evaluation, creation; D) encoding, storage, retrieval, adaptation; E) observation, imitation, practice, feedback

Note: The four basic factors in learning-arousal, motivation, reinforcement, and association-are critical because they collectively influence the processes by which individuals acquire, retain, and apply new knowledge and skills.

3. **Answer:** A

Options: A) rationality versus irrationality; B) stability versus change; C) cognition versus behavior; D) qualitative versus quantitative data; E) conscious versus unconscious influences

Note: The correct answer is rationality versus irrationality because the debate over whether development occurs in distinct stages involves understanding the logical progression of cognitive development versus the unpredictable, sometimes illogical nature of human behavior at different ages.

4. **Answer:** D

Options: A) not mentioned in the ethical guidelines.; B) ethically acceptable, as it provides opportunities for those with lower income.; C) explicitly recommended in the ethical guidelines.; D) ethically acceptable since it serves the best interests of his clients.; E) explicitly recommended in the legal guidelines.

Note: Dr. Manzetti's use of a sliding scale to adjust therapy fees based on clients' income demonstrates ethical practice by ensuring accessibility to mental health services, thereby prioritizing the well-being and financial circumstances of his clients.

5. **Answer:** D

Options: A) psychological term for an uncontrollable state of mind.; B) medical term for a severe mental illness.; C) popular (lay) term for a severe mental illness.; D) legal, non-psychiatric term for certain types of mental disorders.; E) legal, non-psychiatric term for a psychotic disorder with an unknown etiology.

Note: The term "insanity" is used in legal contexts to refer to a defendant's mental

state at the time of a crime, distinguishing it from psychiatric definitions of mental disorders, which focus on clinical diagnoses and treatment.

True / False

6. **Answer:** True

Options: A) True; B) False

Note: Research in cognitive psychology indicates that aging is associated with a decline in processing speed due to neurological changes, including reduced efficiency in neural networks and slower transmission of information across synapses.

7. **Answer:** False

Options: A) True; B) False

Note: Infants initially produce a variety of sounds, but as they develop, they increasingly focus on the phonemes of the language spoken in their environment, leading to a reduction in the range of phonemes they babble.

8. **Answer:** True

Options: A) True; B) False

Note: Validity in test construction is defined as the extent to which a test accurately reflects the specific construct it aims to measure, ensuring that the results are meaningful and relevant to that construct.

9. **Answer:** False

Options: A) True; B) False

Note: Donald Super's career ladder is actually a model that emphasizes the development of self-concept and the various stages of career development rather than a strict sequence of life roles across different life stages.

10. **Answer:** False

Options: A) True; B) False

Note: People in the manic phase of bipolar disorder usually exhibit increased energy levels, heightened activity, and a decreased need for sleep, which contradicts the idea of experiencing extreme fatigue.

Long Form Response

11. **Answer:** Statistical nonsignificance under low power in psychological research implies that the study may not have had enough sensitivity to detect an effect, even if one exists. This outcome can provide limited information about the studied phenomenon, as it does not confirm the absence of an effect but rather suggests that the research design was inadequate to capture it. Low power often arises from small sample sizes or high variability in the data, leading to a higher likelihood of Type II errors. Consequently, researchers might prematurely conclude that there is no relationship or effect when, in reality, the study simply lacked the ability to detect it. Thus, nonsignificant

results under these conditions can mislead interpretations and hinder further inquiry into important psychological constructs.

Note: correct because it highlights that statistical nonsignificance under low power indicates an insufficient ability to detect true effects due to factors like small sample sizes or high variability, which limits the conclusions that can be drawn about the studied phenomenon.

12. **Answer:** Samuel S.'s feeling of impending job loss, despite receiving a bonus, exemplifies the cognitive distortion of arbitrary inference, a concept highlighted in Aaron Beck's cognitive theory. This distortion occurs when an individual draws a conclusion based on insufficient or irrelevant evidence, leading to irrational beliefs. In Samuel's case, the bonus—often a sign of job security—does not alleviate his anxiety about job loss; instead, he interprets the situation negatively without considering the positive implications of his bonus. This illustrates how cognitive distortions can skew perception, causing individuals to focus on potential negative outcomes rather than recognizing the validity of their achievements. Ultimately, Samuel's thoughts reflect a pattern of irrational thinking that undermines his sense of security in his employment.

Note: correct because it illustrates how Samuel S.'s irrational belief about job security, despite receiving a bonus, stems from arbitrary inference, where he draws a negative conclusion without sufficient evidence to support his fear of impending job loss.
