

Multiple Choice

1. **Answer:** A

Options: A) Direct teaching, Punishment, and Extrinsic motivation; B) Cognitive dissonance, Role-playing, and Observational learning; C) Trial and error, Social comparison, and Imitation; D) Exposure, Reinforcement, and Social learning; E) Positive reinforcement, Direct teaching, and Emotional conditioning

Note: Direct teaching, punishment, and extrinsic motivation are all key processes that shape attitudes by influencing behavior through instruction, consequences for actions, and external rewards, respectively, thereby facilitating the learning and internalization of attitudes.

2. **Answer:** A

Options: A) The distinction is dependent on which view you choose to take; B) Propaganda disseminates false information, while education provides only true information; C) Education is designed for individual learning, while propaganda targets groups; D) Propaganda is always biased; E) Propaganda is a form of education that focuses on cultural knowledge

Note: The distinction between education and propaganda is influenced by the perspective one adopts, as education is typically aimed at fostering critical thinking and informed decision-making, while propaganda seeks to influence beliefs and behaviors through persuasive tactics, often lacking objectivity.

3. **Answer:** A

Options: A) frequency theory; B) dual-process theory; C) specificity theory; D) trichromatic; E) gestalt theory

Note: The frequency theory posits that the perception of a tone's pitch is determined by the specific location along the basilar membrane where sound waves peak, with different frequencies stimulating different areas.

4. **Answer:** E

Options: A) Saturation, tone, and pigment; B) Intensity, shade, and tone; C) Chroma, contrast, and clarity; D) Brightness, shade, and chroma; E) Hue, brightness and saturation

Note: The correct answer is attributed to the fact that hue refers to the actual color perception (e.g., red vs. pink), brightness indicates the perceived intensity of light, and saturation describes the purity of the color, all of which together help to explain the differences in appearance between red and pink.

5. **Answer:** A

Options: A) chronological age/verbal score $\times$ 100; B) mental age/performance score $\times$ 100; C) chronological age/performance score $\times$ 100; D) verbal score/chronological age $\times$ 100; E) verbal score/performance score $\times$ 100

Note: The Intelligence Quotient (IQ) is calculated by dividing an individual's chronological age by their verbal score on an intelligence test and then multiplying by 100 to produce a standardized measure of cognitive ability relative to age.

True / False

6. **Answer:** True

Options: A) True; B) False

Note: The statement is true because retinal receptors, such as rods and cones, operate with a different resting membrane potential compared to cochlear hair cells, which affects their sensitivity to light and sound stimuli, respectively, and thus influences their overall function in visual and auditory processing.

7. **Answer:** True

Options: A) True; B) False

Note: Individuals with Wernicke's aphasia produce speech that is grammatically correct and fluent but lacks meaningful content, often resulting in nonsensical or irrelevant language.

8. **Answer:** False

Options: A) True; B) False

Note: The desire to reproduce is influenced by both biological imperatives, such as hormonal drives and evolutionary instincts, and cultural factors, but the biological aspects play a fundamental and primary role in motivating reproductive behavior.

9. **Answer:** True

Options: A) True; B) False

Note: A teratogen is defined as any agent, such as drugs, alcohol, or infections, that can cause malformation or abnormal development in a fetus during pregnancy, thereby negatively impacting fetal development.

10. **Answer:** True

Options: A) True; B) False

Note: Providing information contrary to beliefs, equal-status contact, and interdependence are effective methods for reducing prejudice because these approaches challenge stereotypes, foster understanding and empathy, and promote cooperative interactions among diverse groups, which collectively diminish biases and enhance social cohesion.

Long Form Response

11. **Answer:** Twin studies have significant implications for understanding the role of heredity in shaping personality, suggesting that genetics may completely dictate personality traits, with environmental factors playing no role. Research comparing identical twins raised together and apart indicates that similarities in personality can largely be attributed to genetic inheritance rather than environmental influences. This raises

questions about the extent to which individuals can be shaped by their surroundings, as findings show that even in varying environments, genetic predispositions remain consistent. Overall, the evidence from twin studies underscores a powerful genetic component in personality development, suggesting that heredity may overshadow environmental factors entirely.

Note: The answer correctly highlights that twin studies provide strong evidence for the genetic basis of personality by demonstrating that identical twins, regardless of their upbringing, often exhibit similar personality traits, suggesting that heredity may play a dominant role over environmental factors.

12. **Answer:** Needs analysis in the context of training programs consists of several key components: organizational analysis, task analysis, and person analysis. Organizational analysis examines the broader context, including the company's goals and culture, while task analysis focuses on the specific skills and knowledge required for job performance. Person analysis identifies individual employee needs and gaps in skills or knowledge. However, organizational analysis is often not explicitly included in some training needs assessments, which can lead to a disconnect between training programs and the overall strategic objectives of the organization. This omission can result in ineffective training design, as it fails to align the training with organizational goals, potentially leading to wasted resources and unfulfilled employee potential.

Note: The answer correctly identifies the three essential components of needs analysis-organizational analysis, task analysis, and person analysis-while noting that organizational analysis may be overlooked, which can lead to misalignment between training programs and overall organizational goals.
