

Multiple Choice

1. **Answer:** A

Options: A) Hemiplegia; B) Anxiety Disorders; C) Post-Traumatic Stress Disorder (PTSD); D) Adjustment Disorders

Note: Hemiplegia is a condition that can arise from genetic factors affecting brain development and function, making it relevant as a behavior disorder with a hereditary component.

2. **Answer:** A

Options: A) dissociative identity disorder; B) psychogenic amnesia; C) antisocial personality disorder; D) obsessive-compulsive personality disorder; E) autism spectrum disorder

Note: Electroconvulsive therapy (ECT) is most successfully used with dissociative identity disorder because it can help alleviate severe depressive symptoms and suicidal ideation, which are often present in individuals with this complex condition.

3. **Answer:** A

Options: A) Semiotics; B) Phonology; C) Lexicology; D) Pragmatics; E) grammar

Note: The correct answer is semiotics because it is the study of signs and symbols, including the rules and conventions that dictate how words and phrases are structured and understood within a language.

4. **Answer:** E

Options: A) Implicit memory; B) Autobiographical memory; C) Semantic memory; D) Working memory; E) Episodic memory

Note: Episodic memory is considered the most automatic of the proposed memory systems because it involves the retrieval of specific personal experiences and events without the need for conscious effort, often occurring spontaneously in response to cues.

5. **Answer:** B

Options: A) list 4 only; B) list 1 only; C) lists 2 and 3 only; D) lists 1, 3 and 4 only; E) lists 1 and 4 only

Note: Proactive interference occurs when previously learned information (in this case, list 1) disrupts the recall of new information (list 2), making list 1 the only list that would cause such interference.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: Attribution theory emphasizes that individuals often make biased judgments about others based on limited information and situational factors, indicating that stereotyping is not inherently accurate or justified.

7. **Answer:** False

Options: A) True; B) False

Note: The outer ear is responsible for collecting sound waves and channeling them to the inner ear, where transduction into electrical signals occurs, but it does not directly stimulate the auditory cortex.

8. **Answer:** True

Options: A) True; B) False

Note: Vicarious liability is a significant concern for psychologists serving as supervisors because they may be held legally responsible for the negligent actions of their trainees or staff during their professional duties.

9. **Answer:** False

Options: A) True; B) False

Note: MRI is not always preferred over CT for detecting all types of tumors because while MRI offers higher soft tissue contrast, CT scans are often more effective for identifying certain types of tumors, particularly those involving calcifications or in emergency settings due to their speed and accessibility.

10. **Answer:** False

Options: A) True; B) False

Note: The statement is false because the ability for formal operations and systematic reasoning about abstract concepts develops during Piaget's formal operational stage, which follows the preoperational stage.

Long Form Response

11. **Answer:** Authorship in research carries significant ethical implications, particularly concerning the contributions of senior and junior psychologists in collaborative studies. A senior psychologist, often responsible for the study's design and overall direction, must ensure that junior psychologists are appropriately recognized for their contributions. It is essential for junior psychologists to be listed as co-authors, as this acknowledgment reflects their input and efforts, fostering a sense of collaboration and professional growth. Failure to credit them adequately can lead to feelings of exploitation and diminish their academic recognition. Ultimately, ethical authorship practices promote transparency, accountability, and respect within the research community.
- Note:* correct because it emphasizes the ethical responsibility of senior psychologists to ensure that junior psychologists receive appropriate recognition as co-authors for their contributions, which is crucial for maintaining integrity and fostering collaboration in research.

12. **Answer:** The motive to avoid success, as defined by Matina Horner, refers to a phenomenon where individuals, particularly women, may intentionally limit their achievements in occupational and intellectual domains to prioritize emotional and relational success. This concept suggests that women might fear that excelling in traditionally male-dominated fields could jeopardize their relationships or lead to social repercussions, thereby motivating them to underachieve. Horner's research approach involved qualitative methods, including interviews and surveys, which illuminated the psychological barriers women face in pursuing success. By contextualizing her findings within the broader societal expectations of gender roles, Horner highlighted the tension between professional aspirations and personal relationships, ultimately providing insight into how these dynamics influence women's career choices.

Note: correct because it accurately captures Horner's definition of the motive to avoid success as a fear among women of jeopardizing relationships by excelling in male-dominated areas, and it briefly outlines her research focus on this phenomenon within occupational and intellectual contexts.
