

Multiple Choice

1. **Answer:** A

Options: A) 12 in males only; B) 10 in both sexes; C) 12 in females and 14 in males; D) 12 in both sexes; E) 14 in both sexes

Note: The statement is incorrect, as menarche refers specifically to the first menstrual cycle in females, typically occurring around age 12, and does not apply to males, highlighting a misunderstanding of biological processes related to puberty in different genders.

2. **Answer:** B

Options: A) Biological frustrations, cultural frustrations, and educational frustrations; B) Environmental frustrations, personal frustrations, and conflict frustrations; C) Academic frustrations, economic frustrations, and ethical frustrations; D) Aesthetic frustrations, health-related frustrations, and legal frustrations; E) Social frustrations, mental frustrations, and philosophical frustrations

Note: The correct answer identifies three major types of frustration-environmental, personal, and conflict-each highlighting different sources of obstacles that individuals encounter in their pursuit of goals, thereby encompassing the broad spectrum of frustration experiences within psychological contexts.

3. **Answer:** B

Options: A) reactive attachment disorder; B) separation anxiety; C) stranger anxiety; D) avoidant attachment; E) secure attachment

Note: Separation anxiety is a normal developmental stage in which infants exhibit distress when separated from their primary attachment figure, reflecting their emotional bond and dependence on that figure for security.

4. **Answer:** B

Options: A) Adlerian; B) reality; C) person-centered; D) existential; E) Gestalt

Note: Reality therapy focuses on helping individuals identify and change their perceptions of themselves from a "failure identity" to a "success identity," emphasizing personal responsibility and the fulfillment of basic needs through effective choices and goal-setting.

5. **Answer:** D

Options: A) 10; B) 7; C) 9.5; D) 8; E) 6

Note: The median is determined by sorting the scores in ascending order (4, 5, 6, 7, 8, 9, 9, 9, 10) and identifying the middle value, which in this case is 8, as it is the fifth score in a list of nine scores.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: The statement is false because a person in the pseudoindependent stage recognizes that racism exists and is an ongoing issue, rather than believing it has been completely resolved.

7. **Answer:** False

Options: A) True; B) False

Note: Research indicates that younger women, particularly those in their late teens to early twenties, are more frequently identified as users of suicide prevention services compared to elderly Caucasian women, making the statement false.

8. **Answer:** True

Options: A) True; B) False

Note: Research has shown that decreased levels of acetylcholine, a neurotransmitter crucial for memory and learning, are associated with the cognitive decline observed in Alzheimer's disease, highlighting a significant connection between the two.

9. **Answer:** False

Options: A) True; B) False

Note: Research has consistently indicated that exposure to non-violent television programming does not correlate with an increase in aggressive behavior, and may instead promote positive social interactions and emotional well-being.

10. **Answer:** True

Options: A) True; B) False

Note: In the three-box information processing model, sensory memory is indeed the first stage because it temporarily holds vast amounts of sensory information before it is processed for further storage in short-term or long-term memory.

Long Form Response

11. **Answer:** Individual factors, such as socioeconomic status and personal beliefs, significantly influence one's ability to cope with conflict and can contribute to the development of neuroses. Those from lower socioeconomic backgrounds may face increased stressors, such as financial instability and limited access to mental health resources, which can hinder effective conflict resolution and increase vulnerability to anxiety and depression. Conversely, individuals with strong personal beliefs or coping strategies—such as resilience, optimism, and social support—tend to navigate conflicts more successfully, thus reducing the likelihood of developing neuroses. By understanding these factors, we can better appreciate the complex interplay between an individual's background and their mental health outcomes.

Note: correct because it highlights the impact of socioeconomic status on stress and resource availability, as well as the role of personal beliefs in shaping coping strategies,

both of which are crucial for understanding how individuals manage conflict and their susceptibility to neuroses.

12. **Answer:** Intelligence is primarily shaped by environmental factors, which play a crucial role in cognitive development and learning. While genetics may provide a potential range for intelligence, it is the environment-encompassing education, socioeconomic status, nutrition, and social interactions-that ultimately influences an individual's intellectual capabilities. For instance, access to quality education and stimulating activities can significantly enhance cognitive skills, while adverse conditions can hinder development. This perspective underscores the importance of fostering supportive environments to nurture intelligence, suggesting that environmental influences are paramount in determining intellectual outcomes. Thus, while genetic predispositions exist, they are often overshadowed by the profound impact of environmental factors in shaping intelligence.

Note: correct because it emphasizes that while genetics set a potential range for intelligence, it is the environmental factors-such as education, socioeconomic status, and social interactions-that fundamentally shape and enhance an individual's cognitive abilities.
