

Multiple Choice

1. **Answer:** E

Options: A) shaping; B) backward conditioning; C) habituation; D) generalization; E) acquisition trials

Note: The correct answer is "acquisition trials" because this phase in classical conditioning involves the repeated pairing of a neutral stimulus with an unconditioned stimulus, leading to the neutral stimulus eliciting a conditioned response in anticipation of the unconditioned stimulus.

2. **Answer:** A

Options: A) Tell them to stay busy to distract themselves from their thoughts; B) Discourage them from talking about their thoughts or feelings to anyone; C) Encourage the use of alcohol or drugs to cope with their feelings; D) Avoid discussing the person's problems; E) Suggest that their feelings are not that serious and will pass in time

Note: Staying busy can serve as a distraction from suicidal thoughts, helping individuals to engage in positive activities and reduce the intensity of their distress, which is a common strategy employed by suicide prevention counselors.

3. **Answer:** A

Options: A) parietal lobe is to frontal lobe."; B) temporal lobe is to parietal lobe."; C) temporal lobe is to frontal lobe."; D) occipital lobe is to parietal lobe."; E) parietal lobe is to occipital lobe."

Note: The correct answer "parietal lobe is to frontal lobe" reflects the analogy of sensory processing, where vision (associated with the occipital lobe) is to hearing (associated with the temporal lobe) as the parietal lobe, which processes sensory information and spatial awareness, is to the frontal lobe, which is involved in decision-making and higher cognitive functions.

4. **Answer:** D

Options: A) social skills training; B) encouraging competitive sports and games; C) exposure to a nonaggressive model; D) opportunities for catharsis

Note: Opportunities for catharsis, which involve expressing emotions or frustrations, may reinforce aggressive behavior rather than reduce it, as they can lead children to believe that acting out is an acceptable way to cope with their feelings.

5. **Answer:** A

Options: A) Construct validity is the physical representation of a test; B) Construct validity is the cultural relevance of a test to various groups.; C) Construct validity is the ease of conducting a test; D) Construct validity is the environmental impact of administering a test.; E) Construct validity refers to the transparency of the test-making process.

Note: Construct validity refers to the extent to which a test accurately measures the

theoretical construct it is intended to represent, thus making it a critical aspect of the physical representation of a test in evaluating its relevance and effectiveness in psychological research.

True / False

6. **Answer:** True

Options: A) True; B) False

Note: Large-group programs that focus on enhancing children's self-esteem are considered a form of tertiary prevention in schools because they aim to address and mitigate the negative impacts of existing psychosocial issues by promoting resilience and positive psychological development.

7. **Answer:** False

Options: A) True; B) False

Note: Standardized tests can be administered at various intervals, including multiple times a year, and may focus on specific skills rather than a wide range of academic abilities.

8. **Answer:** True

Options: A) True; B) False

Note: Time-out procedures involve removing a positive reinforcer, such as attention or privileges, to decrease the likelihood of undesirable behavior by creating a consequence that reduces the reinforcement of that behavior.

9. **Answer:** True

Options: A) True; B) False

Note: The statement is true because epidemiological studies consistently show that the lifetime prevalence of schizophrenia is about 1% of the population, equating to approximately 1 in 100 individuals.

10. **Answer:** True

Options: A) True; B) False

Note: The heritability of 75% in a cloned population indicates that a significant portion of the variation in traits is due to genetic factors, as clones share nearly identical genetic makeup, minimizing environmental influences.

Long Form Response

11. **Answer:** Information processing theory explains rapid reading for meaning by highlighting the redundancy inherent in the English language, which allows readers to quickly infer meaning without fully processing every word. This redundancy means that certain letters or phrases can be predicted based on context, enabling readers to fill in gaps and continue reading fluidly. Additionally, prior knowledge plays a critical role, as individuals draw on their past experiences and familiarity with language

to anticipate meanings, thereby enhancing their comprehension speed. Consequently, these cognitive processes enable readers to efficiently extract meaning from text while minimizing the need for detailed analysis of each word.

Note: correct because it emphasizes how language redundancy facilitates quick inferences during reading, allowing readers to predict and fill in meanings, while also recognizing the importance of prior knowledge in enhancing comprehension and fluency.

12. **Answer:** Fatalism, the belief that events are predetermined and individuals have little control over their destinies, holds significant cultural value in many Asian and Asian American communities. This perspective often stems from historical, religious, and philosophical influences, such as Confucianism and Buddhism, which emphasize acceptance and harmony with the natural order of life. The prevalence of fatalism can impact psychological well-being by fostering resilience in the face of adversity, as individuals may view challenges as part of a larger cosmic plan. However, it can also lead to feelings of helplessness and reduced motivation to enact change, particularly when external circumstances are perceived as insurmountable. Understanding these dynamics is crucial for mental health professionals working within these communities, as they must navigate the balance between respecting cultural beliefs and promoting proactive coping strategies.

Note: correct because it identifies fatalism as a culturally significant belief in many Asian and Asian American communities, rooted in philosophical traditions, and explains its psychological impact by linking it to resilience and acceptance in facing life's challenges.
