

Multiple Choice

1. **Answer:** A

Options: A) Verbal cues are effective as motivational sources only in specific cultural contexts.; B) Only non-verbal stimuli can serve as sources of drive.; C) Verbal stimuli serve as a source of drive exclusively in early childhood development.; D) Verbal stimuli are an innate source of drive, not acquired.; E) Verbal stimuli are not an acquired source of drive.

Note: Verbal cues can serve as motivational sources because their effectiveness is influenced by cultural contexts, which shape how individuals interpret and respond to language-based stimuli.

2. **Answer:** A

Options: A) reinforcement; B) an unconditioned stimulus; C) conditioned response; D) operant conditioning; E) generalization

Note: The correct answer is reinforcement because, in classical conditioning, the dogs salivating at the sound of the tone after repeated pairings with food demonstrates that the tone has acquired the ability to elicit a conditioned response, which is a fundamental aspect of the reinforcement process in learning.

3. **Answer:** B

Options: A) Skinner's behaviorism; B) Adler's individual psychology.; C) Beck's cognitive-behavioral therapy.; D) Perls's Gestalt therapy.; E) Erikson's stages of psychosocial development

Note: This is correct because Adler's individual psychology posits that children's misbehavior is motivated by a desire to achieve specific goals related to social belonging and personal significance, specifically categorized as seeking attention, revenge, asserting power, or expressing feelings of inadequacy.

4. **Answer:** A

Options: A) Decreased blood pressure, heightened sensory perception, faster reaction times; B) Strengthened cognitive abilities, longer lifespan, better pain tolerance; C) Enhanced problem-solving skills, increased emotional stability, improved coordination; D) Sharper focus, accelerated learning ability, increased creativity; E) Improved cardiovascular health, reduced inflammation, increased energy levels

Note: The correct answer highlights that sleep deprivation can lead to physiological changes such as decreased blood pressure while also enhancing sensory perception and reaction times due to the body's compensatory mechanisms in response to fatigue.

5. **Answer:** C

Options: A) Intensity of the unconditioned stimulus; B) Conditioned stimuli; C) Temporal contiguity; D) Sequence of stimuli; E) Spatial contiguity

Note: Temporal contiguity is the principle that emphasizes the importance of the timing and sequence of stimuli in both classical and operant conditioning, as it determines the strength and effectiveness of the learned associations between behaviors and their consequences or stimuli.

True / False

6. **Answer:** True

Options: A) True; B) False

Note: In a conjunctive task, the overall success of the group relies on the contributions of its least skilled member, as the group's performance is constrained by the individual who performs the worst, thereby highlighting the importance of each member's capabilities in achieving collective goals.

7. **Answer:** True

Options: A) True; B) False

Note: The statement is true because both structuralists and behaviorists emphasize the importance of observable phenomena and the systematic analysis of behavior, prioritizing empirical observation over introspection or subjective experience.

8. **Answer:** True

Options: A) True; B) False

Note: The statement is true because when individuals comply with a request for a small reward, they may experience cognitive dissonance, leading them to change their beliefs to align with their actions and justify their compliance.

9. **Answer:** False

Options: A) True; B) False

Note: The correction for attenuation formula assesses how the reliability of a test affects the correlation between two measures, rather than evaluating how a test's difficulty impacts its reliability.

10. **Answer:** False

Options: A) True; B) False

Note: Research indicates that men typically exhibit higher levels of aggressive behavior in crowded conditions compared to women, who may respond with different coping mechanisms that do not involve aggression.

Long Form Response

11. **Answer:** Rosenhan's research with "pseudopatients" effectively illustrates how the environment influences the perception of behavior in psychiatric contexts. By having individuals feign auditory hallucinations to gain admission into various psychiatric hospitals, he demonstrated that once labeled as mentally ill, their subsequent normal behaviors were interpreted through the lens of that diagnosis. For instance, the

pseudopatients were often viewed as exhibiting pathological behaviors, such as writing notes or asking questions, despite these actions being entirely benign. This research underscores the significant impact of contextual factors, such as the setting of a psychiatric facility and the expectations of medical staff, on the interpretation of behaviors, highlighting the potential for misdiagnosis and the stigmatization of individuals based solely on their environment. Ultimately, Rosenhan's study calls attention to the need for a more nuanced understanding of mental health that accounts for situational influences on behavior.

Note: correct because it emphasizes how the labeling of individuals as mentally ill leads to a biased interpretation of their behavior, demonstrating the significant role that the psychiatric environment plays in shaping perceptions of normality and abnormality.

12. **Answer:** Dr. Leonard Lykowski must carefully consider the ethical implications of feeling hostility towards a therapy client, particularly as it may compromise the therapeutic alliance and the client's progress. It is essential for him to recognize that personal feelings can cloud professional judgment, thus potentially harming the client. To navigate this situation ethically, Lykowski should consult with another psychologist to evaluate whether he can continue seeing the client effectively or if a referral is more appropriate. This step not only provides a third-party perspective but also ensures that the client's well-being remains the priority, aligning with ethical standards in psychology. By seeking guidance, Lykowski demonstrates professionalism and a commitment to ethical practice.

Note: correct because it emphasizes the importance of recognizing personal biases that may affect professional judgment and highlights the ethical necessity of seeking consultation to ensure the client's well-being and maintain the integrity of the therapeutic process.
