

Multiple Choice

1. **Answer:** D

Options: A) By conducting the experiment with subject's peers present; B) By offering financial incentives to the subjects; C) By making the subject aware they are being observed; D) Through field experimentation and 'nonobtrusive' approaches; E) By providing subjects with false feedback on their performance

Note: The correct answer is that field experimentation and 'nonobtrusive' approaches can eliminate evaluation apprehension because these methods allow researchers to observe participants in natural settings without causing them to feel scrutinized or judged, thus reducing the likelihood of performance anxiety that can skew results.

2. **Answer:** A

Options: A) "Aggressive Energy" theory and "Natural Born Killer" theory; B) "Game" theory and "Cognitive Neoassociation" theory; C) "Psychoanalytic" theory and "Drive" theory; D) "Dominance" theory and "Behaviorist" theory; E) "Evolution" theory and "Conflict" theory

Note: The "Aggressive Energy" theory posits that aggression is a natural and necessary expression of energy that builds up within individuals, while the "Natural Born Killer" theory suggests that certain individuals are biologically predisposed to aggression, both of which support the belief that aggression is an inherent and necessary part of human behavior.

3. **Answer:** A

Options: A) Exponential; B) Sinusoidal; C) Polynomial; D) Quadratic; E) Rational

Note: The correct answer is exponential because converting the total number of errors to a percent correct involves a transformation that reflects a non-linear relationship, where the proportion of correct responses is derived from the total possible responses, effectively representing an exponential change in the data interpretation.

4. **Answer:** A

Options: A) Three subtypes of anxiety disorders are listed in DSM-III; B) Five subtypes of dissociative disorders are listed in DSM-III; C) Six subtypes of depression disorders are listed in DSM-III; D) Eight subtypes of somatoform disorders are listed in DSM-III; E) Seven subtypes of eating disorders are listed in DSM-III

Note: The correct answer is supported by the fact that DSM-III categorizes anxiety disorders into three specific subtypes: phobic disorders, panic disorders, and generalized anxiety disorder, which collectively help in understanding the classification and treatment of these conditions.

5. **Answer:** E

Options: A) Mental rotation; B) Visual-spatial tasks; C) Abstract reasoning tests; D) Emotional intelligence tests; E) Simultaneous processing

Note: Simultaneous processing, which involves the ability to integrate multiple sources of information simultaneously, has been shown in research to not significantly differ between genders, making it an exception to the trend of men outperforming women in other cognitive tasks.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: High-achieving students who fear success often avoid applying to prestigious universities due to anxiety about the expectations and pressures associated with attending such institutions.

7. **Answer:** True

Options: A) True; B) False

Note: Children's successful adjustment to their parents' divorce is significantly influenced by the level of post-divorce conflict between the parents because high levels of conflict can lead to increased emotional distress and behavioral problems in children, while low conflict can promote healthier adjustment and coping strategies.

8. **Answer:** False

Options: A) True; B) False

Note: The linguistic relativity hypothesis asserts that language influences thought and perception, suggesting that different languages reflect different structures and meanings, thereby indicating that not all languages are fundamentally the same.

9. **Answer:** True

Options: A) True; B) False

Note: A psychologist is legally obligated to comply with a subpoena and testify at a deposition, even regarding a current therapy client, unless a valid privilege or confidentiality exception applies.

10. **Answer:** False

Options: A) True; B) False

Note: A functional analysis is conducted to identify how the independent variable influences the dependent variables, not to identify the dependent variables themselves.

Long Form Response

11. **Answer:** Aggressiveness is primarily determined by genetic inheritance, suggesting that it is an instinctual behavior rooted in our biological makeup. Studies have shown that certain genetic factors can predispose individuals to aggressive tendencies, indicating that aggression may be an inherited trait passed down through generations. While environmental factors, such as upbringing and social influences, do play a role in shaping behavior, they often interact with these genetic predispositions rather than

override them. Therefore, understanding aggressiveness through the lens of genetic inheritance provides a clearer perspective on its instinctual nature, highlighting the biological basis that underlies aggressive behaviors in humans.

Note: The answer correctly highlights that aggressiveness has a biological basis supported by genetic inheritance, while also acknowledging the significant, though interacting, influence of environmental factors on aggressive behavior.

12. **Answer:** Self-disclosure by psychologists in object relations therapy plays a crucial role in enhancing the therapeutic relationship by fostering trust and intimacy between therapist and client. The theoretical foundations of this practice are rooted in the understanding that early interpersonal relationships shape an individual's internal world, influencing their current relational patterns. By sharing relevant personal experiences, therapists can model healthy relational dynamics and provide clients with a sense of connection, helping them to explore their own object relations. However, it is essential for therapists to balance self-disclosure with professional boundaries, ensuring that the focus remains on the client's therapeutic needs. This careful management of self-disclosure can facilitate deeper insights and promote healing within the therapeutic context.

Note: correct because it emphasizes the importance of self-disclosure in building trust and intimacy in the therapeutic relationship, linking it to the theoretical foundation of object relations therapy that focuses on how early relationships influence current behaviors and relational patterns.
