

Multiple Choice

1. **Answer:** A

Options: A) Symbolic; B) Postoperational; C) Concrete operational; D) Sensorimotor; E) Foundational

Note: The correct answer is "Symbolic" because during Piaget's Symbolic stage, which typically occurs between ages 2 and 7, children begin to use language and mental representations to describe their experiences, enabling them to articulate thoughts about people, events, and feelings.

2. **Answer:** D

Options: A) avoid setting any specific goals to maintain flexibility; B) focus on developing a deep understanding of the crisis before setting goals; C) try to ensure that the client becomes calm and relaxed; D) agree upon clear-cut goals and keep the sessions focused on these goals; E) primarily use medication as a means of managing the crisis

Note: Brief crisis-oriented therapy emphasizes the establishment of specific, achievable goals to provide direction and maintain focus during sessions, facilitating effective and efficient resolution of the client's immediate issues.

3. **Answer:** A

Options: A) During adolescence only; B) From birth to late childhood only; C) During infancy only; D) From birth to early adulthood only; E) From infancy through adolescence only

Note: The correct answer is "During adolescence only" because Piaget's theory culminates in the formal operational stage, which typically begins in adolescence and involves the development of abstract and hypothetical thinking.

4. **Answer:** A

Options: A) Ecstasy; B) Marijuana; C) Alcohol; D) Cocaine; E) Tobacco

Note: The risk of withdrawal delirium is greatest following the discontinuation of ecstasy due to its effects on serotonin levels, leading to significant neurochemical imbalances that can trigger severe withdrawal symptoms.

5. **Answer:** A

Options: A) Method of Levels, Method of Average Error, Method of Standard Deviation; B) Method of Constant Stimuli, Method of Right and Wrong Cases, Variability method; C) Method of Approximation, Method of Differential Error, Method of Least Squares; D) Method of Limits, Method of Comparative Error, Method of Estimation; E) Method of Limits, Method of Median Error, Frequency method

Note: The correct answer identifies the three fundamental approaches used in psychophysics to assess sensory thresholds, with each method offering distinct advantages in measuring perceptual sensitivity and variability in responses.

True / False

6. **Answer:** False

Options: A) True; B) False

Note: The statement is false because bulimia nervosa is specifically characterized by recurrent episodes of binge eating followed by compensatory behaviors such as purging, whereas anorexia nervosa primarily involves restricted food intake and does not necessarily include purging behaviors.

7. **Answer:** False

Options: A) True; B) False

Note: Psychology primarily studies individual and group behavior and mental processes rather than historical events, emphasizing current human experiences and interactions.

8. **Answer:** True

Options: A) True; B) False

Note: The recovery rate in individuals using self-help resources is a valid comparison for assessing psychotherapy effectiveness because it allows for the evaluation of different approaches to mental health treatment, highlighting the potential benefits and limitations of psychotherapy relative to self-directed interventions.

9. **Answer:** True

Options: A) True; B) False

Note: Individuals with schizophrenia often exhibit dysregulation in their autonomic nervous system, which can manifest as persistent low-level arousal, contributing to their heightened sensitivity to stress and emotional disturbances.

10. **Answer:** True

Options: A) True; B) False

Note: Father's age and diet, along with parental education, are considered environmental factors because they can affect the overall health and well-being of both the mother and fetus, thereby influencing prenatal development outcomes.

Long Form Response

11. **Answer:** The Thematic Apperception Test (TAT) serves several experimental applications in psychology, notably in distinguishing between groups, assessing emotional intensity, and evaluating the effects of experimental manipulations. By analyzing the narratives created by participants in response to ambiguous images, researchers can identify differing psychological needs and motivations across various demographics or clinical populations. Additionally, the TAT can be used to gauge emotional intensity by examining the themes, conflicts, and resolutions present in the stories that individuals construct, providing insight into their emotional states. Furthermore, the test is valuable for assessing the impact of specific experimental manipulations, as changes in narrative themes or emotional expression can reflect shifts in participants' psychological conditions or responses to interventions. Overall, the TAT is a versatile tool

that enhances our understanding of individual differences and psychological processes in experimental settings.

Note: correct because it accurately describes how the TAT's qualitative analysis of participants' narratives allows researchers to differentiate between psychological needs across groups, assess emotional intensity, and evaluate the impact of experimental manipulations.

12. **Answer:** Baltes et al. (1999) found that the implementation of flexitime in organizations significantly reduces job stress and enhances overall employee well-being. By allowing employees to choose their work hours, flexitime facilitates a better work-life balance, which in turn alleviates stress associated with rigid schedules and personal obligations. This flexibility empowers employees, leading to increased job satisfaction and motivation. Furthermore, the reduction in job stress contributes to improved mental health and productivity, indicating that flexitime is a beneficial organizational strategy for promoting a healthier work environment. Overall, the findings underscore the importance of flexibility in fostering employee well-being.

Note: correct because it accurately summarizes Baltes et al. (1999) findings that flexitime promotes a better work-life balance, reduces job stress, and enhances employee well-being through increased job satisfaction and motivation.
